

Processing Signal and **Machine Learning**

1. Hypothesis Testing

1.1. Definition Statistical Model

Statistical Model: $\{X, F, P_{\theta}; \theta \in \Theta\}$

Sample Space: Observation Space: \mathbb{X} Sigma Algebra Probability:

 $T: \mathbb{X} \mapsto \{\theta_0, \theta_1\}, x \mapsto T(x)$

Null Hypothesis: $H_0: \theta \in \Theta_0$ Alternative Hypothesis: $H_1: \theta \in \Theta_1$

Cost Criterion G_T :

 $G_T: \{\theta_0,\theta_1\} \xrightarrow{\cdot} [0,1], \theta \mapsto P(\{T(X)=1\}|\theta)$ $= E[T(X);\theta] = \int T(x) f_X(x|\theta) \,\mathrm{d}x$

Error Level α : $G_T(\theta_0) \le \alpha$ Two Error Types:

False Alarm: $\theta = \theta_0, T(x) = 1$ $G_T(\theta_0) = P(\{T(X) = 1\} | \theta_0)$ Detection Error: $\theta = \theta_1, T(x) = 0$

 $1 - G_T(\theta_1) = P(\{T(X) = 0\} | \theta_1)$

1.2. Maximum Likelihood Test

ML Ratio Test Statistic:

ML Ratio lest statistic:
$$R(x) = \begin{cases} \frac{f_X(x|\theta_1)}{f_X(x|\theta_0)} \; ; & f_X(x|\theta_0) > 0 \\ \infty & ; & f_X(x|\theta_0) = 0 \text{ and } f_X(x|\theta_1) > 0 \end{cases}$$

$$T_{\mathsf{ML}}: \mathbb{X} \mapsto \{0,1\}, x \mapsto \begin{cases} 1 & ; & R(X) > c \\ 0 & ; & \mathsf{otherwise} \end{cases}$$

if $c \neq 1$ False Alarm Error Probability can be adjusted \rightarrow Neyman Pear-

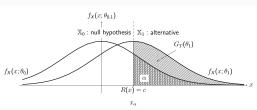

1.3. Neyman-Pearson-Test

The best test of P_0 against P_1 is

$$T_{\text{NP}}(x) = \begin{cases} 1 & R(x) > c & \text{Likelihood-Ratio:} \\ \gamma & R(x) = c & R(x) = \frac{f_{X}(x|\theta_{1})}{f_{X}(x|\theta_{0})} \\ 0 & R(x) < c & R(x) = \frac{f_{X}(x|\theta_{1})}{f_{X}(x|\theta_{0})} \end{cases}$$

$$\gamma = \frac{\alpha - P_{0}(\{R > c\})}{P_{0}(\{R = c\})} \quad \text{Errorlevel } \alpha$$

Steps: For α calculate x_{α} , then $c = R(x_{\alpha})$

 $\mbox{ Maximum Likelihood Detector: } T_{\mbox{\scriptsize ML}}(x)$

ROC Graphs: plot $G_T(\theta_1)$ as a function of $G_T(\theta_0)$

1.4. Bayes Test (MAP Test)

Prior knowledge about possible hypotheses:

$$\begin{split} & \mathsf{P}(\{\theta \in \Theta_0\}) + \mathsf{P}(\{\theta \in \Theta_1\}) = 1 \\ & T_{\mathsf{Bayes}} = \underset{T}{\operatorname{argmin}} \{P_{\epsilon}\} = \begin{cases} 1 & ; & \frac{f_X(x|\theta_1)}{f_X(x|\theta_0)} > c \\ 0 & ; & \mathsf{otherwise} \end{cases} \\ & \begin{cases} 1 & ; & \mathsf{P}(\theta_1|x) > \mathsf{P}(\theta_0|x) \end{cases} \end{split}$$

$$= \begin{cases} 1 & ; & \mathsf{P}(\theta_1|x) > \mathsf{P}(\theta_0|x) \\ 0 & ; & \mathsf{otherwise} \end{cases}$$

$$P_{\epsilon} = P(\theta_0)G_T(\theta_0) + P(\theta_1)(1 - G_T(\theta_1)), \quad c = \frac{P(\theta_0)}{P(\theta_1)}$$

if
$$P(\theta_0) = P(\theta_1) \rightarrow T_{\mathsf{Baves}} = T_{\mathsf{ML}}$$

Multiple Hypothesis $\{\theta_0,...,\theta_k\}; \mathbb{X}_0,...,\mathbb{X}_k \in \mathbb{X}$: $T_{\mathsf{Bayes}} = \operatorname*{argmin}_{k \in 1, \dots, K} \{ P(\theta_k | x) \}$

Loss Function

$$L(T(x),\theta) = \begin{cases} L_0 & ; \quad T(x) = 1, \text{ but } \theta = \theta_0 \quad \text{(FALSE ALARM)} \\ L_1 & ; \quad T(x) = 0, \text{ but } \theta = \theta_1 \quad \text{(DETEC. ERROR)} \\ 0 & ; \quad \text{otherwise} \end{cases}$$

 L_i denotes the Loss Value in cases where the correct decision parameter θ_i is missed.

 $\operatorname{Risk}(T) = \mathsf{E}[L(T(X), \theta)] = \mathsf{E}[\mathsf{E}[L(T(x), \theta)|x = X]]$

1.5. Linear Alternative Tests

Estimate normal vector \boldsymbol{w}^{\top} and w_0 , which separate \mathbb{X} into \mathbb{X}_0 and \mathbb{X}_1 $\log R(\underline{\boldsymbol{x}}) = \frac{\ln(\det(\underline{\boldsymbol{C}}_0))}{\ln(\det(\underline{\boldsymbol{C}}_1))} + \frac{1}{2}(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_0)^{\top}\underline{\boldsymbol{C}}_0^{-1}(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_0) -\frac{1}{2}(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_1)^{\top} \underline{\boldsymbol{C}}_1^{-1}(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_1) = 0$

For 2 Gaussians, with $C_0 = C_1 = C \rightarrow \log R(\underline{x}) = \underline{w}^{\top}\underline{x} - w_0$: $\underline{\boldsymbol{w}}^\top = (\underline{\boldsymbol{\mu}}_1 - \underline{\boldsymbol{\mu}}_0)^\top \underline{\boldsymbol{C}} \quad \text{(Normal Vector)}$

$$\begin{array}{l} w_0 = \frac{-1}{(\underline{\mu}_1 - \underline{\mu}_0)^T} \underbrace{\underline{C}(\underline{\mu}_1 - \underline{\mu}_0)}_{C} \quad \text{(Constant Translation)} \\ \to T: \mathbb{X} \to \mathbb{R}, \underline{\underline{x}} \mapsto \begin{cases} 1 & \underline{\underline{w}}^T \underline{\underline{x}} - w_0 > 0 \\ 0 & \text{otherwise} \end{cases} \quad \text{(Affine Decision Rule)} \end{array}$$

For Gaussian $f_X(x;\mu_k,C_k)$ with θ_0 and θ_1 corresponding to $\{\mu_0, C_0\}$ and $\{\mu_1, C_1\}$, it follows that

- if $C_0 \neq C_1$, log R(x) = 0 is non-linear and the separating surfaces are surfaces of second order: parabolic, hyperbolic, or elliptic
- ullet if $C_0=C_1$, log R(x)=0 is affine and thus defines a hyperplane in \mathbb{X} which decomposes \mathbb{X} into \mathbb{X}_0 and \mathbb{X}_1 , i.e.,

$$T: \mathbb{X} \to \mathbb{R}, \underline{\boldsymbol{x}} \mapsto \begin{cases} 1 & \underline{\boldsymbol{w}}^\top \underline{\boldsymbol{x}} > w_0 \\ 0 & \text{otherwise} \end{cases}$$

 \bullet if $C_0=C_1$ and $\mu_0=-\mu_1$, log R(x)=0 is linear and defines a separating hyperplane in $\ensuremath{\mathbb{X}}$ which contains the origin, i.e.,

$$T: \mathbb{X} \to \mathbb{R}, \underline{\boldsymbol{x}} \mapsto \begin{cases} 1 & \underline{\boldsymbol{w}}^{\top}\underline{\boldsymbol{x}} > \\ 0 & \text{otherwise} \end{cases}$$

2. Hypothesis Testing

(vielleicht noch was davon übernehmen)

2.1. Definition

Null hypothesis $H_0: \theta \in \Theta_0$ (Assumed first to be true) Alternate hypothesis $H_1:\theta\in\Theta_1$ (The one to proof)

Descision rule $\varphi: \mathbb{X} \to [0,1]$ with

 $\varphi(x)=1$: decide for H_1 , $\varphi(x)=0$: decide for H_0 Error level α with $E[d(X)|\theta] \le \alpha, \forall \theta \in \Theta_0$

Error Type	Decision	H_1 false (H_0 true)	H_1 true (H_0 false)
1 (FA) False	H_1 rejected	True Negative	False Negative (Type 2)
Alarm	$(H_0 \; {\it accepted})$	$P = 1 - \alpha$	$P = \beta$
, ,	H_1 accepted (H_0 rejected)	False Positive (Type 1) $P = \alpha$	True Positive $P = 1 - \beta$

Power: Sensitivity/Recall/Hit Rate: $\frac{\text{TP}}{\text{TP+FN}} = 1 - \beta$ Specificity/True negative rate: $\frac{TN}{FP \perp TN} = 1 - \alpha$

Precision/Positive Prediciton rate: TP

Accuracy: $\frac{TP+TN}{P+N} = \frac{2-\alpha-\beta}{2}$

2.1.1. Design of a test

Cost criterion $G_{\varphi}:\Theta\to [0,1], \theta\mapsto \mathsf{E}[d(X)|\theta]$

False Positive lower than α : $G_d(\theta)|_{\theta \in \Theta_0} \leq \alpha, \forall \theta \in \Theta_0$ False Negative small as possible: $\max\{G_d(\theta)|_{\theta\in\Theta_1}\}, \forall \theta\in\Theta_1$

2.2. Sufficient Statistics

Sufficiency for a test T(X) means that no other test statistic, i.e., function of the observations \underline{x} , contains additional information about the parameter

$$f_{X\mid T}(x|T(x)=t,\theta) = f_{X\mid T}(x|T(x)=t)$$

3. Math

 $\pi \approx 3.141\,59$ $e \approx 2.718\,28$ $\sqrt{2} \approx 1.414$ $\sqrt{3} \approx 1.732$ Binome, Trinome $(a \pm b)^2 = a^2 \pm 2ab + b^2$ $a^2 - b^2 = (a - b)(a + b)$ $(a \pm b)^3 = a^3 \pm 3a^2b + 3ab^2 \pm b^3$ $(a+b+c)^2 = a^2 + b^2 + c^2 + 2ab + 2ac + 2bc$

Folgen und Reihen

$\sum_{k=1}^{n} k = \frac{n(n+1)}{2}$	$\sum_{k=0}^{n} q^k = \frac{1 - q^{n+1}}{1 - q}$	$\sum_{n=0}^{\infty} \frac{\mathbf{z}^n}{n!} = e^{\mathbf{z}}$
Aritmetrische Summenformel	Geometrische Summenformel	Exponentialreihe

$$\begin{array}{ll} \mbox{Ungleichungen:} & \mbox{Bernoulli-Ungleichung:} \ (1+x)^n \geq 1+nx \\ \big| |x|-|y| \big| \leq |x\pm y| \leq |x|+|y| & \Big| \frac{\underline{x}^\top \cdot \underline{y}}{\mbox{Cauchy-Schwarz-Ungleichung}} \Big| \leq \|\underline{x}\| \cdot \|\underline{y}\| \end{array}$$

$$\begin{array}{lll} \textbf{3.1. Exp. und Log.} & e^x := \lim_{n \to \infty} \left(1 + \frac{x}{n}\right)^n & & e \approx 2,71828 \\ a^x = e^{x \ln a} & & \log_a x = \frac{\ln x}{\ln a} & & \ln x \leq x - 1 \\ \ln(x^a) = a \ln(x) & & \ln(\frac{x}{a}) = \ln x - \ln a & & \log(1) = 0 \end{array}$$

3.2. Matrizen $\mathbf{A} \in \mathbb{K}^{m \times n}$

$$\begin{split} \underline{\boldsymbol{\mathcal{A}}} &= (a_{ij}) \in \mathbb{K}^{m \times n} \text{ hat } m \text{ Zeilen (Index } i) \text{ und } n \text{ Spalten (Index } j) \\ &(\underline{\boldsymbol{\mathcal{A}}} + \underline{\boldsymbol{\mathcal{B}}})^\top = \underline{\boldsymbol{\mathcal{A}}}^\top + \underline{\boldsymbol{\mathcal{B}}}^\top & (\underline{\boldsymbol{\mathcal{A}}} \cdot \underline{\boldsymbol{\mathcal{B}}})^\top = \underline{\boldsymbol{\mathcal{B}}}^\top \cdot \underline{\boldsymbol{\mathcal{A}}}^\top \\ &(\underline{\boldsymbol{\mathcal{A}}}^\top)^{-1} = (\underline{\boldsymbol{\mathcal{A}}}^{-1})^\top & (\underline{\boldsymbol{\mathcal{A}}} \cdot \underline{\boldsymbol{\mathcal{B}}})^{-1} = \underline{\boldsymbol{\mathcal{B}}}^{-1} \underline{\boldsymbol{\mathcal{A}}}^{-1} \end{aligned}$$

 $\dim \mathbb{K} = n = \operatorname{rang} \mathbf{A} + \dim \ker \mathbf{A} \quad \operatorname{rang} \mathbf{A} = \operatorname{rang} \mathbf{A}^{\top}$

3.2.1. Quadratische Matrizen $A \in \mathbb{K}^{n \times n}$

regulär/invertierbar/nicht-singulär $\Leftrightarrow \det(\mathbf{A}) \neq 0 \Leftrightarrow \operatorname{rang} \mathbf{A} = n$ singulär/nicht-invertierbar $\Leftrightarrow \det(\mathbf{A}) = 0 \stackrel{\sim}{\Leftrightarrow} \operatorname{rang} \mathbf{A} \neq n$ orthogonal $\Leftrightarrow \boldsymbol{A}^{\top} = \boldsymbol{A}^{-1} \Rightarrow \det(\boldsymbol{A}) = \pm 1$

symmetrisch: $\boldsymbol{A} = \boldsymbol{A}^{\top}$ schiefsymmetrisch: $\boldsymbol{A} = -\boldsymbol{A}^{\top}$

3.2.2. Determinante von $\mathbf{A} \in \mathbb{K}^{n \times n}$: $\det(\mathbf{A}) = |\mathbf{A}|$ $\det\begin{bmatrix} \boldsymbol{A} & \boldsymbol{0} \\ \boldsymbol{C} & \boldsymbol{D} \end{bmatrix} = \det\begin{bmatrix} \boldsymbol{A} & \boldsymbol{B} \\ \boldsymbol{0} & \boldsymbol{D} \end{bmatrix} = \det(\boldsymbol{\underline{A}}) \det(\boldsymbol{\underline{D}})$

 $\det(\mathbf{A}) = \det(\mathbf{A}^T)$ $\det(\mathbf{A}^{-1}) = \det(\mathbf{A})^{-1}$ $\det(\mathbf{A}\mathbf{B}) = \det(\mathbf{A})\det(\mathbf{B}) = \det(\mathbf{B})\det(\mathbf{A}) = \det(\mathbf{B}\mathbf{A})$ Hat \mathbf{A} 2 linear abhäng. Zeilen/Spalten $\Rightarrow |\mathbf{A}| = 0$

3.2.3. Eigenwerte (EW) λ und Eigenvektoren (EV) \underline{v}

$$\underline{A}\underline{v} = \lambda \underline{v}$$
 det $\underline{A} = \prod \lambda_i$ Sp $\underline{A} = \sum a_{ii} = \sum \lambda_i$

Eigenwerte: $det(\mathbf{A} - \lambda \mathbf{1}) = 0$ Eigenvektoren: $ker(\mathbf{A} - \lambda_i \mathbf{1}) = \underline{\mathbf{v}}_i$ EW von Dreieck/Diagonal Matrizen sind die Elem. der Hauptdiagonale. 3.2.4. Spezialfall 2×2 Matrix A

$$\frac{\partial \underline{\underline{w}}^{\top}\underline{\underline{y}}}{\partial \underline{\underline{x}}} = \frac{\partial \underline{\underline{y}}^{\top}\underline{\underline{x}}}{\partial \underline{\underline{x}}} = \underline{\underline{y}} \qquad \frac{\partial \underline{\underline{x}}^{\top}\underline{\underline{A}}\underline{\underline{x}}}{\partial \underline{\underline{x}}} = (\underline{\underline{A}} + \underline{\underline{A}}^{\top})\underline{\underline{x}}$$
$$\frac{\partial \underline{\underline{w}}^{\top}\underline{\underline{A}}\underline{\underline{y}}}{\partial \underline{\underline{A}}} = \underline{\underline{x}}\underline{\underline{y}}^{\top} \qquad \frac{\partial \det(\underline{\underline{B}}\underline{\underline{A}}\underline{\underline{C}})}{\partial \underline{\underline{A}}} = \det(\underline{\underline{B}}\underline{\underline{A}}\underline{\underline{C}}) \left(\underline{\underline{A}}^{-1}\right)^{\top}$$

3.2.6. Ableitungsregeln ($\forall \lambda, \mu \in \mathbb{R}$)

Linearität:	$(\lambda f + \mu g)'(x) = \lambda f'(x) + \mu g'(x_0)$
Produkt:	$(f \cdot g)'(x) = f'(x)g(x) + f(x)g'(x)$
Quotient:	$\left(\frac{f}{g}\right)'(x) = \frac{g(x)f'(x) - f(x)g'(x)}{g(x)^2} \left(\frac{\text{NAZ-ZAN}}{\text{N}^2}\right)$
Kettenregel	(f(q(x)))' = f'(q(x))q'(x)

3.3. Integrale $\int e^x dx = e^x = (e^x)'$

Partielle Integration: $\int uw' = uw - \int u'w$ $\int f(g(x))g'(x) dx = \int f(t) dt$

F(x) - C	f(x)	f'(x)
$\frac{1}{q+1}x^{q+1}$	x^q	qx^{q-1}
$\frac{2\sqrt{ax^3}}{3}$	\sqrt{ax}	$\frac{a}{2\sqrt{ax}}$
$x \ln(ax) - x$	ln(ax)	$\frac{1}{x}$
$\frac{1}{a^2}e^{ax}(ax-1)$	$x \cdot e^{ax}$	$e^{ax}(ax+1)$
$\frac{a^x}{\ln(a)}$	a^x	$a^x \ln(a)$
$-\cos(x)$	$\sin(x)$	$\cos(x)$
$\cosh(x)$	sinh(x)	$\cosh(x)$
$-\ln \cos(x) $	tan(x)	$\frac{1}{\cos^2(x)}$

$$\int e^{at} \sin(bt) dt = e^{at} \frac{a \sin(bt) + b \cos(bt)}{a^2 + b^2}$$

$$\int \frac{dt}{\sqrt{at + b}} = \frac{2\sqrt{at + b}}{a} \qquad \int t^2 e^{at} dt = \frac{(ax - 1)^2 + 1}{a^3} e^{at}$$

$$\int te^{at} dt = \frac{at - 1}{a^2} e^{at} \qquad \int xe^{ax^2} dx = \frac{1}{2a} e^{ax^2}$$

3.3.1. Volumen und Oberfläche von Rotationskörpern um x-Achse $V = \pi \int_a^b f(x)^2 dx$ $O = 2\pi \int_{a}^{b} f(x) \sqrt{1 + f'(x)^2} dx$

4. Probability Theory Basics

4.1. Kombinatorik

Mögliche Variationen/Kombinationen um k Elemente von maximal n Elementen zu wählen bzw. k Elemente auf n Felder zu verteilen:

	Mit Reihenfolge	Reihenfolge egal
Mit Wiederholung	$n^k \ n!$	$\binom{n+k-1}{k}$
Ohne Wiederholung	$\overline{(n-k)!}$	$\binom{k}{k}$

Permutation von n mit jeweils k gleichen Elementen: $\frac{n!}{k_1! \cdot k_2! \cdot \dots \cdot k_n!}$

Binomialkoeffizient
$$\binom{n}{k} = \binom{n}{n-k} = \frac{n!}{k! \cdot (n-k)!}$$

 $\binom{n}{0} = 1$ $\binom{n}{1} = n$ $\binom{4}{2} = 6$ $\binom{5}{2} = 10$ $\binom{6}{2} = 15$

4.2. Der Wahrscheinlichkeitsraum (Ω, \mathbb{F}, P)

Ergebnismenge	$\Omega = \left\{\omega_1, \omega_2, \ldots\right\}$	Ergebnis $\omega_j \in \Omega$
Ereignisalgebra	$\mathbb{F} = \left\{A_1, A_2, \ldots\right\}$	Ereignis $A_i \subseteq \Omega$
Wahrscheinlichkeitsmaß	$P:\mathbb{F}\to[0,1]$	$P(A) = \frac{ A }{ \Omega }$

4.3. Wahrscheinlichkeitsmaß P

$$P(A) = \frac{|A|}{|\Omega|} \qquad \qquad P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

4.3.1. Axiome von Kolmogorow

Nichtnegativität: $P(A) > 0 \Rightarrow P : \mathbb{F} \mapsto [0, 1]$

Additivität:
$$\mathsf{P}\left(\bigcup_{i=1}^{\infty}A_i\right) = \sum_{i=1}^{\infty}\mathsf{P}(A_i), \\ \mathsf{wenn}\ A_i \cap A_j = \emptyset, \ \forall i \neq j$$

4.4. Bedingte Wahrscheinlichkeit

Bedingte Wahrscheinlichkeit für A falls B bereits eingetreten ist: $P_B(A) = P(A|B) = \frac{P(A \cap B)}{P(B)}$

4.4.1. Totale Wahrscheinlichkeit und Satz von Bayes Es muss gelten: $\bigcup_i B_i = \Omega$ für $B_i \cap B_j = \emptyset$, $\forall i \neq j$

 $\begin{aligned} & \text{Totale Wahrscheinlichkeit:} & & \text{P}(A) = \sum\limits_{i \in I} \text{P}(A|B_i) \, \text{P}(B_i) \\ & \text{Satz von Bayes:} & & \text{P}(B_k|A) = \frac{\sum\limits_{i \in I} \text{P}(A|B_i) \, \text{P}(B_k)}{\sum\limits_{i \in I} \text{P}(A|B_i) \, \text{P}(B_i)} \end{aligned}$

Multiplikationssatz: $P(A \cap B) = P(A|B) P(B) = P(B|A) P(A)$

4.5. Zufallsvariable

 $X: \Omega \mapsto \Omega'$ ist Zufallsvariable, wenn für jedes Ereignis $A' \in \mathbb{F}'$ im Bildraum ein Ereignis A im Urbildraum $\mathbb F$ existiert, sodass $\{\omega \in \Omega | X(\omega) \in A'\} \in \mathbb{F}$

4.6. Distribution

Bezeichnung	Abk.	Zusammenhang
Wahrscheinlichkeitsdichte	pdf	$f_X(x) = \frac{\mathrm{d}F_X(x)}{\mathrm{d}x}$
Kumulative Verteilungsfkt.	cdf	$F_X(x) = \int_{-\infty}^x f_X(\xi) \mathrm{d}\xi$

Joint CDF: $F_{X,Y}(x,y) = P(\{X \le x, Y \le y\})$

4.7. Relations between $f_{\mathbf{X}}(x), f_{\mathbf{X},\mathbf{Y}}(x,y), f_{\mathbf{X}\mid\mathbf{Y}}(x|y)$

$$\begin{aligned} f_{X,Y}(x,y) &= f_{X\mid Y}(x,y) f_{Y}(y) = f_{Y\mid X}(y,x) f_{X}(x) \\ & \underbrace{\int\limits_{-\infty}^{\infty} f_{X,Y}(x,\xi) \, \mathrm{d}\xi}_{\text{Marginalization}} &= \underbrace{\int\limits_{-\infty}^{\infty} f_{X\mid Y}(x,\xi) f_{Y}(\xi) \, \mathrm{d}\xi}_{\text{Total Probability}} = f_{X}(x) \end{aligned}$$

4.8. Bedingte Zufallsvariablen

Ereignis A gegeben:	$F_{X A}(x A) = P(\{X \le x\} A)$
ZV Y gegeben:	$F_{X \mid Y}(x y) = P(\{X \le x\} \{Y = y\})$
	$p_{X Y}(x y) = \frac{p_{X,Y}(x,y)}{p_{Y}(y)}$
	$f_{X Y}(x y) = \frac{f_{X,Y}(x,y)}{f_{Y}(y)} = \frac{\mathrm{d}F_{X Y}(x y)}{\mathrm{d}x}$
	$f_{Y}(y)$ dx

4.9. Unabhängigkeit von Zufallsvariablen

 X_1, \dots, X_n sind stochastisch unabhängig, wenn für jedes $x \in \mathbb{R}^n$ gilt: $F_{X_1,\dots,X_n}(x_1,\dots,x_n) = \prod_{i=1}^n F_{X_i}(x_i)$ $p_{\mathsf{X}_1,\cdots,\mathsf{X}_n}(x_1,\cdots,x_n) = \prod_{i=1}^n p_{\mathsf{X}_i}(x_i)$

 $f_{X_1,\dots,X_n}(x_1,\dots,x_n) = \prod_{i=1}^n f_{X_i}(x_i)$

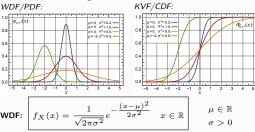

5. Common Distributions

5.1. Binomialverteilung $\mathcal{B}(n,p)$ mit $p \in [0,1], n \in \mathbb{N}$ Folge von n Bernoulli-Experimenten

p: Wahrscheinlichkeit für Erfolg k: Anzahl der Erfolge

$$p_{X}(k) = B_{n,p}(k) = \begin{cases} \binom{n}{k} p^{k} (1-p)^{n-k} & k \in \{0, \dots, n\} \\ 0 & \text{sonst} \end{cases}$$

5.2. Normalverteilung

5.3. Sonstiges

Gammadistribution $\Gamma(\alpha, \beta)$: $E[X] = \frac{\alpha}{\beta}$

Exponential: $f(x, \lambda) = \lambda e^{-\lambda x}$ $E[X] = \lambda^{-1}$ $Var[X] = \lambda^{-2}$

6. Wichtige Parameter

6.1. Erwartungswert (1. zentrales Moment)

gibt den mittleren Wert einer Zufallsvariablen an

$$\begin{array}{ccc} \mu_X = \mathsf{E}[X] = \sum\limits_{\substack{x \in \Omega' \\ \mathsf{diskrete}\, X: \Omega \to \Omega'}} x \cdot \mathsf{P}_X(x) & \overset{\triangle}{=} & \int\limits_{\mathbb{R}} x \cdot f_X(x) \, \mathrm{d}x \\ & \mathsf{stetige}\, X: \Omega \to \mathbb{R} \end{array}$$

 $E[\alpha X + \beta Y] = \alpha E[X] + \beta E[Y]$ $X \leq Y \Rightarrow E[X] \leq E[Y]$ $\mathsf{E}[X^2] = \mathsf{Var}[X] + \mathsf{E}[X]^2$

E[X Y] = E[X] E[Y], falls X und Y stochastisch unabhängig Umkehrung nicht möglichich: Unkorrelliertheit

Stoch. Unabhängig!

6.1.1. Für Funktionen von Zufallsvariablen g(x)

$$\mathsf{E}[g(X)] = \sum_{x \in \Omega'} g(x) \, \mathsf{P}_X(x) \quad \stackrel{\wedge}{=} \quad \int\limits_{\mathbb{R}} g(x) f_X(x) \, \mathrm{d}x$$

6.2. Varianz (2. zentrales Moment)

ist ein Maß für die Stärke der Abweichung vom Erwartungswert

$$\sigma_X^2 = \mathsf{Var}[X] = \mathsf{E}\left[(X - \mathsf{E}[X])^2 \right] = \mathsf{E}[X^2] - \mathsf{E}[X]^2$$

$$Var[\alpha X + \beta] = \alpha^2 Var[X]$$
 $Var[X] = Cov[X, X]$

$$\begin{aligned} & \operatorname{Var}\left[\sum_{i=1}^n X_i\right] = \sum_{i=1}^n \operatorname{Var}[X_i] + \sum_{j \neq i} \operatorname{Cov}[X_i, X_j] \\ & \operatorname{Standard Abweichung: } \sigma = \sqrt{\operatorname{Var}[X]} \end{aligned}$$

6.3. Kovarianz

Maß für den linearen Zusammenhang zweier Variablen

$$Cov[X, Y] = E[(X - E[X])(Y - E[Y])^{\top}] =$$

$$= E[X Y^{\top}] - E[X] E[Y]^{\top} = Cov[Y, X]$$

$$\begin{array}{l} \mathsf{Cov}[\alpha\,X+\beta,\gamma\,Y+\delta] = \,\alpha\gamma\,\mathsf{Cov}[X,\,Y] \\ \mathsf{Cov}[X+U,\,Y+V] = \,\mathsf{Cov}[X,\,Y] + \,\mathsf{Cov}[X,\,V] + \,\mathsf{Cov}[U,\,Y] + \,\mathsf{Cov}[U,\,V] \end{array}$$

6.3.1. Korrelation = standardisierte Kovarianz

$$\rho(\mathbf{X},\mathbf{Y}) = \frac{\mathsf{Cov}[\mathbf{X},\mathbf{Y}]}{\sqrt{\mathsf{Var}[\mathbf{X}]\cdot\mathsf{Var}[\mathbf{Y}]}} = \frac{C_{x,y}}{\sigma_{x}\cdot\sigma_{y}} \qquad \rho(\mathbf{X},\mathbf{Y}) \in [-1;1]$$

6.3.2. Kovarianzmatrix für $\underline{z} = (\underline{x}, y)$

$$\mathsf{Cov}[\underline{\boldsymbol{z}}] = \underline{\boldsymbol{C}}_{\underline{\boldsymbol{z}}} = \begin{bmatrix} C_X & C_{XY} \\ C_{XY} & C_Y \end{bmatrix} = \begin{bmatrix} \mathsf{Cov}[X,X] & \mathsf{Cov}[X,Y] \\ \mathsf{Cov}[Y,X] & \mathsf{Cov}[Y,Y] \end{bmatrix}$$

Immer symmetrisch: $C_{xy} = C_{yx}!$ Für Matrizen: $C_{xy} = C_{yx}!$

7. Estimation

7.1. Estimation

Statistic Estimation treats the problem of inferring underlying characteristics of unknown random variables on the basis of observations of outputs of those random variables.

Sample Space Ω Sigma Algebra $\mathbb{F} \subseteq 2^\Omega$

nonempty set of outputs of experiment

Probability $P : \mathbb{F} \mapsto [0, 1]$

Random Variable $X: \Omega \mapsto \mathbb{X}$ mapped subsets of Ω Observations: x_1, \ldots, x_N single values of X

Observation Space X Unknown parameter $\theta \in \Theta$ set of subsets of outputs (events)

possible observations of X

parameter of propability function Estimator $\bigcirc - \bullet : \mathbb{X} \mapsto \Theta$ $\circ - \bullet (X) = \hat{\theta}$, finds $\hat{\theta}$ from X

unknown parm. θ R.V. of param. Θ estimation of param. $\hat{\theta}$ estim. of R.V. of parm $T(X) = \hat{\Theta}$

7.2. Quality Properties of Estimators

Consistent: If
$$\lim_{N\to\infty} \bigcirc - \bullet (x_1,\dots,x_N) = \theta$$

Bias $\operatorname{Bias}(\bigcirc - \bullet) := \operatorname{E}[\bigcirc - \bullet (X_1,\dots,X_N)] - \theta$
unbiased if $\operatorname{Bias}(\bigcirc - \bullet) = 0$ (biased estimators can provide better estimators).

timates than unbiased estimators.) Variance Var $[\bigcirc \bullet] := E [(\bigcirc \bullet - E [\bigcirc \bullet])^2]$

7.3. Mean Square Error (MSE)

 $E\left[\left(\bigcirc - E\left[\bigcirc - E\right]\right)^2\right]$:

$$\varepsilon[\circ - \bullet] = \mathsf{E} \left[(\circ - \bullet - \theta)^2 \right]^{\mathsf{MSE}} = \mathsf{Var}(\circ - \bullet) + (\mathsf{Bias}[\circ - \bullet])^2$$

If Θ is also r.v. \Rightarrow mean over both (e.g. Bayes est.):

Mean MSE:
$$E[(\bigcirc \bullet \bullet (X) - \Theta)^2]$$

 $E[E[(\bigcirc \bullet \bullet (X) - \Theta)^2]$

7.3.1. Minimum Mean Square Error (MMSE)

Minimizes mean square error: $\arg \min \mathsf{E}\left[(\hat{\theta} - \theta)^2\right]$

$$\mathsf{E}\left[(\hat{\theta} - \theta)^2\right] = \mathsf{E}[\theta^2] - 2\hat{\theta}\,\mathsf{E}[\theta] + \hat{\theta}^2$$

Solution:
$$\frac{\mathrm{d}}{\mathrm{d}\hat{\theta}} \mathsf{E} \left[(\hat{\theta} - \theta)^2 \right] \stackrel{!}{=} 0 = -2 \, \mathsf{E}[\theta] + 2\hat{\theta} \quad \Rightarrow \hat{\theta}_{\mathsf{MMSE}} = \mathsf{E}[\theta]$$

7.4. Maximum Likelihood

Given model $\{X, F, P_{\theta}; \theta \in \Theta\}$, assume $P_{\theta}(\underline{x})$ or $f_X(\underline{x}, \theta)$ for observed data \boldsymbol{x} . Estimate parameter θ so that the likelihood $L(\boldsymbol{x},\theta)$ or $L(\theta | X = x)$ to obtain x is maximized.

Likelihood Function: (Prob. for θ given x)

 $L(x_1,\ldots,x_N;\theta) = \mathsf{P}_{\theta}(x_1,\ldots,x_N)$ Continuous: $L(x_1,\ldots,x_N;\theta)=f_{X_1,\ldots,X_N}(x_1,\ldots,x_N,\theta)$ If N observations are Identically Independently Distributed (i.i.d.):

 $L(\underline{\boldsymbol{x}},\boldsymbol{\theta}) = \; \prod^{N} \; \mathsf{P}_{\boldsymbol{\theta}}(\boldsymbol{x}_i) = \; \prod^{N} \; f_{\mathsf{X}_i}(\boldsymbol{x}_i)$

ML Estimator (Picks θ): $O \longrightarrow ML : X \mapsto argmax\{L(X, \theta)\} =$

 $= \underset{\theta \in \Theta}{\operatorname{argmax}} \{ \log L(\underline{X}, \theta) \} \stackrel{\text{i.i.d.}}{=} \underset{\theta \in \Theta}{\operatorname{argmax}} \{ \sum \log L(x_i, \theta) \}$

Find Maximum: $\frac{\partial L(\underline{x},\theta)}{\partial \theta} = \frac{\mathrm{d}}{\mathrm{d}\theta} \log L(x;\theta) \Big|_{\hat{x} = \hat{x}} \stackrel{!}{=} 0$ Solve for θ to obtain ML estimator function $\hat{\theta}_{\text{MI}}$

Check quality of estimator with MSE

Maximum-Likelihood Estimator is Asymptotically Efficient. However, there might be not enough samples and the likelihood function is often not known

7.5. Uniformly Minimum Variance Unbiased (UMVU) Estimators (Best unbiased estimators)

Best unbiased estimator: Lowest Variance of all estimators. Fisher's Information Inequality: Estimate lower bound of variance if

- $L(x,\theta) > 0, \forall x, \theta$
- $L(x, \theta)$ is diffable for θ
- $\bullet \ \int_{\mathbb{X}} \frac{\partial}{\partial \theta} L(x,\theta) \, \mathrm{d}x = \frac{\partial}{\partial \theta} \int_{\mathbb{X}} L(x,\theta) \, \mathrm{d}x$ Score Function:

 $g(x,\theta) = \frac{\partial}{\partial \theta} \log L(x,\theta) = \frac{\frac{\partial}{\partial \theta} \, L(x,\theta)}{L(x,\theta)} \qquad \mathsf{E}[g(x,\theta)] = 0$

 $I_{\mathsf{F}}(\theta) := \mathsf{Var}[g(X, \theta)] = \mathsf{E}[g(X, \theta)^2] = -\,\mathsf{E}\left[\frac{\partial^2}{\partial \theta^2}\log L(X, \theta)\right]$

Cramér-Rao Lower Bound (CRB): (if O- is unbiased)

For N i.i.d. observations: $I_{\rm F}^{\left(N\right)}(x,\theta)=N\cdot I_{\rm F}^{\left(1\right)}(x,\theta)$

7.5.1. Exponential Models

If
$$f_X(x) = \frac{h(x) \exp\left(a(\theta)t(x)\right)}{\exp(b(\theta))}$$
 then $I_F(\theta) = \frac{\partial a(\theta)}{\partial \theta} \frac{\partial E[t(X)]}{\partial \theta}$

Some Derivations: (check in exam)

Uniformly: Not diffable \Rightarrow no $I_{\mathcal{F}}(\theta)$

Normal $\mathcal{N}(\theta, \sigma^2)$: $g(x, \theta) = \frac{(x-\theta)}{\sigma^2}$ $I_{\mathsf{F}}(\theta) = \frac{1}{\sigma^2}$ Binomial $\mathcal{B}(\theta, K)$: $g(x, \theta) = \frac{x}{\theta} - \frac{K - x}{1 - \theta}$ $I_{\mathsf{F}}(\theta) = \frac{K}{\theta(1 - \theta)}$

7.6. Bayes Estimation (Conditional Mean)

A Priori information about $\hat{\theta}$ is known as probability $f_{\Theta}(\theta;\sigma)$ with random variable Θ and parameter σ . Now the conditional pdf $f_{X \mid \Theta}(x, \theta)$ is used to find θ by minimizing the mean MSE instead of uniformly MSE.

Mean MSE for Θ : $\mathbb{E}\left[\mathbb{E}[(T(X) - \Theta)^2 | \Theta = \theta]\right]$

Conditional Mean Estimator:

$$\begin{array}{l} T_{\mathsf{CM}}: x \mapsto \mathsf{E}[\Theta | X = x] = \int_{\Theta} \theta \cdot f_{\Theta | X}(\theta | x) \, \mathrm{d}\theta \\ \text{Posterior } f_{\Theta | \underline{X}}(\theta | \underline{x}) = \frac{f_{\underline{X} | \Theta}(\underline{x}) f_{\theta}(\theta)}{\int_{\Theta} f_{X, \xi}(\underline{x}, \xi) \, \mathrm{d}\xi} = \frac{f_{\underline{X} | \Theta}(\underline{x}) f_{\theta}(\theta)}{f_{X}(x)} \end{array}$$

Hint: to calculate $f_{\Theta|X}(\theta|\underline{x})$: Replace every factor not containing θ , such as $\frac{1}{f_{N}(x)}$ with a factor γ and determine γ at the end such that $\int_{\Theta} f_{\Theta|X}(\hat{\theta}|\underline{x}) d\theta = 1$ MMSE: $E[Var[X | \Theta = \theta]]$

Multivariate Gaussian: $X, \Theta \sim \mathcal{N} \Rightarrow \sigma_X^2 = \sigma_{X \mid \Theta - \theta}^2 + \sigma_{\Theta}$ $\circ -\!\!\!\!\!- \bullet_{\mathsf{CM}} : x \mapsto \mathsf{E}[\Theta|\, X = x] = \underline{\mu}_{\Theta} + \underline{C}_{\Theta,X} \underline{C}_X^{-1} (\underline{x} - \underline{\mu}_X)$ $\begin{array}{l} \text{MMSE:} \\ \mathbb{E} \left[\| \circ - \bullet_{\text{CM}} - \Theta \|_2^2 \right] = \operatorname{tr}(\tilde{\boldsymbol{C}}_{\boldsymbol{\theta} \mid \boldsymbol{X}}) = \operatorname{tr}(\tilde{\boldsymbol{C}}_{\boldsymbol{\Theta}} - \tilde{\boldsymbol{C}}_{\boldsymbol{\Theta}, \boldsymbol{X}} \tilde{\boldsymbol{C}}_{\boldsymbol{X}}^{-1} \tilde{\boldsymbol{C}}_{\boldsymbol{X}, \boldsymbol{\Theta}}) \end{array}$

 $O \longrightarrow CM(X) - \Theta \perp h(X) \Rightarrow E[(T_{CM}(X) - \Theta)h(X)] = 0$ MMSE Estimator: $\hat{\theta}_{\text{MMSE}} = \arg\min \text{ MSE}$

minimizes the MSE for all estimators

7.7. Example:

Estimate mean θ of X with prior knowledge $\theta \in \Theta \sim \mathcal{N}$: $X \sim \mathcal{N}(\theta, \sigma_{X \mid \Theta = \theta}^2)$ and $\Theta \sim \mathcal{N}(m, \sigma_{\Theta}^2)$

$$\hat{\theta}_{\mathsf{CM}} = \mathsf{E}[\Theta|\underline{X} = \underline{x}] = \frac{N\sigma_{\Theta}^2}{\sigma_{X}^2 \mid_{\Theta = \theta}^2 + N\sigma_{\Theta}^2} \hat{\theta}_{\mathsf{ML}} + \frac{\sigma_{X}^2 \mid_{\Theta = \theta}^2}{\sigma_{X}^2 \mid_{\Theta = \theta}^2 + N\sigma_{\Theta}^2} m$$

For N independent observations $x_i \colon \hat{\theta}_{\mathsf{ML}} = \frac{1}{N} \sum x_i$ Large $N \Rightarrow \mathsf{ML}$ better, small $N \Rightarrow \mathsf{CM}$ better

8. Linear Estimation

t is now the unknown parameter θ , we want to estimate u and \underline{x} is the input vector... review regression problem $y=A\underline{x}$ (we solve for \underline{x}), here we solve for \underline{t} , because \underline{x} is known (measured)! Confusing... 1. Training → 2. Estimation

Training: We observe y and x (knowing both) and then based on that we try to estimate y given x (only observe x) with a linear model $\hat{y} = \boldsymbol{x}^{\top} \boldsymbol{t}$

Estimation:
$$\hat{y} = \mathbf{x}^{\top} \mathbf{t} + m$$
 or $\hat{y} = \mathbf{x}^{\top} \mathbf{t}$

Given: N observations $(y_i, \underline{\boldsymbol{x}}_i)$, unknown parameters $\underline{\boldsymbol{t}}$, noise m

$$\underline{\boldsymbol{y}} = \begin{bmatrix} y_1 \\ \vdots \\ y_n \end{bmatrix} \quad \underline{\boldsymbol{X}} = \begin{bmatrix} \underline{\boldsymbol{x}}_1^\top \\ \vdots \\ \underline{\boldsymbol{x}}_n^\top \end{bmatrix} \quad \text{Note: } \hat{\boldsymbol{y}} \neq \boldsymbol{y}$$

Problem: Estimate y based on given (known) observations \underline{x} and unknown parameter t with assumed linear Model: $\hat{y} = x^{\top} t$

Note $y = \underline{\underline{x}}^{\top} \underline{\underline{t}} + m \to y = \underline{\underline{x}}'^{\top} \underline{\underline{t}}'$ with $\underline{\underline{x}}' = \left(\underline{\underline{x}}\right)$, $t' = \left(\underline{\underline{t}}\right)$

Sometimes in Exams: $\hat{y} = \underline{x}^{\top}\underline{t} \Leftrightarrow \hat{\underline{x}} = \underline{T}^{\top}y$ estimate \underline{x} given y and unknown T

8.1. Least Square Estimation (LSE)

Tries to minimize the square error for linear Model: $\hat{y}_{1S} = \underline{x}^{\top}\underline{t}_{1S}$ Least Square Error: $\min \left| \sum_{i=1}^{N} (y_i - \underline{x}_i^{\top} \underline{t})^2 \right| = \min_{\underline{t}} \left\| \underline{y} - \underline{X}\underline{t} \right\|$

$$t_{\mathsf{LS}} = (\boldsymbol{X}^{\top} \boldsymbol{X})^{-1} \boldsymbol{X}^{\top} \boldsymbol{y}$$

 $\hat{y}_{1S} = X\underline{t}_{1S} \in span(X)$

Orthogonality Principle: N observations $\boldsymbol{x}_i \in \mathbb{R}^d$ $Y - XT_{1S} \perp \operatorname{span}[X] \Leftrightarrow Y - XT_{1S} \in \operatorname{null}[X^{\top}]$, thus $\mathbf{X}^{\top}(\mathbf{Y} - \mathbf{X}\mathbf{T}_{1S}) = 0$ and if $N > d \wedge \operatorname{rang}[\mathbf{X}] = d$: $T_{\mathsf{LS}} = (\mathbf{X}^{\top} \mathbf{X})^{-1} \mathbf{X}^{\top} \mathbf{Y}$

8.2. Linear Minimum Mean Square Estimator (LMMSE)

Estimate y with linear estimator t, such that $\hat{y} = t^{\top}x + m$ Note: the Model does not need to be linear! The estimator is linear!

$$\hat{y}_{\mathsf{LMMSE}} = \mathop{\arg\min}_{t,\,m} \mathsf{E} \left[\left\| \underline{\boldsymbol{y}} - (\underline{\boldsymbol{t}}^{\top}\underline{\boldsymbol{x}} + m) \right\|_2^2 \right]$$

If Random joint variable $\underline{z} = \left(\frac{\underline{x}}{z}\right)$ with

$$\underline{\underline{\mu}}_{\underline{\underline{z}}} = \begin{pmatrix} \underline{\underline{\mu}}_{\underline{\underline{w}}} \\ \underline{\mu}_{y} \end{pmatrix} \text{ and } \underline{C}_{\underline{\underline{z}}} = \begin{bmatrix} \underline{C}_{\underline{\underline{w}}} & \underline{c}_{\underline{\underline{w}}y} \\ c_{y}\underline{\underline{w}} & c_{y} \end{bmatrix} \text{ then }$$

 $\left\| \text{Minimum MSE: E} \left[\left\| \underline{\boldsymbol{y}} - (\underline{\boldsymbol{x}}^\top \underline{\boldsymbol{t}} + m) \right\|_2^2 \right] = c_{\boldsymbol{y}} - c_{\boldsymbol{y}\underline{\boldsymbol{x}}} C_{\underline{\boldsymbol{x}}}^{-1} \underline{\boldsymbol{c}}_{\underline{\boldsymbol{x}} \boldsymbol{y}}$

Hint: First calculate \hat{y} in general and then set variables according to system equation.

Multivariate: $\hat{\underline{y}} = \tilde{\underline{x}}_{LMMSE}^{\top} \underline{\underline{x}}$ $\tilde{\underline{x}}_{LMMSE}^{\top} = \tilde{\underline{C}}_{y\underline{x}}\tilde{\underline{C}}_{x}^{-1}$

If $\underline{\mu}_{oldsymbol{z}}=\underline{\mathbf{0}}$ then

Estimator $\hat{y} = \underline{c}_{y, \boldsymbol{x}} \boldsymbol{C}_{\boldsymbol{x}}^{-1} \underline{\boldsymbol{x}}$

Minimum MSE: $E[c_{y,\underline{x}}] = c_y - \underline{t}^{\top}\underline{c}_{x,x}$

8.3. Matched Filter Estimator (MF)

For channel y = hx + v, Filtered: $t^{\top}y = t^{\top}hx + t^{\top}v$ Find Filter t^{\top} that maximizes SNR = $\frac{\|\underline{h}x\|}{\|x\|^{2}}$

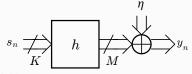

$$\underline{\boldsymbol{t}}_{\mathsf{MF}} = \max_{\boldsymbol{t}} \left\{ \frac{\mathsf{E}\left[(\underline{\boldsymbol{t}}^{\top} \underline{\boldsymbol{h}} \boldsymbol{x})^2 \right]}{\mathsf{E}\left[(\underline{\boldsymbol{t}}^{\top} \underline{\boldsymbol{v}})^2 \right]} \right\}$$

In the lecture (estimate \underline{h})

$$\underline{\underline{T}}_{\mathsf{MF}} = \max_{T} \left\{ \frac{\left| \mathbf{E} \left[\underline{\hat{\boldsymbol{h}}}^H \underline{\boldsymbol{h}} \right] \right|^2}{\operatorname{tr} \left[\mathsf{Var} \left[\underline{\underline{T}} \underline{\boldsymbol{n}} \right] \right]} \right\}$$

 $\hat{\underline{h}}_{\mathsf{MF}} = T_{\mathsf{MF}} \boldsymbol{y} \qquad T_{\mathsf{MF}} \propto \boldsymbol{C}_{\boldsymbol{h}} \boldsymbol{S}^H \boldsymbol{C}_{\boldsymbol{n}}^{-1}$

8.4. Example

System Model: $\boldsymbol{y}_n = \boldsymbol{H} \boldsymbol{\underline{s}}_n + \eta_n$

$$\begin{array}{l} \text{with } \underline{H} = (h_{m,k}) \in \mathbb{C}^{M \times K} \qquad (m \in [1,M], k \in [1,K]) \\ \text{Linear Channel Model } \underline{y} = \underline{S}\underline{h} + \underline{n} \text{ with } \\ \underline{h} \sim \mathcal{N}(0, \underline{C}_{h}) \text{ and } \underline{n} \sim \widetilde{\mathcal{N}}(0, \underline{C}_{n}) \end{array}$$

Linear Estimator T estimates $\hat{\boldsymbol{h}} = T\boldsymbol{y} \in \mathbb{C}^{MK}$

$$\tilde{\boldsymbol{T}}_{\mathrm{MMSE}} = \tilde{\boldsymbol{C}}_{\underline{\boldsymbol{h}}\underline{\boldsymbol{y}}} \tilde{\boldsymbol{C}}_{\underline{\boldsymbol{y}}}^{-1} = \tilde{\boldsymbol{C}}_{\underline{\boldsymbol{h}}} \tilde{\boldsymbol{S}}^{\mathrm{H}} (\tilde{\boldsymbol{S}} \tilde{\boldsymbol{C}}_{\underline{\boldsymbol{h}}} \tilde{\boldsymbol{S}}^{\mathrm{H}} + \tilde{\boldsymbol{C}}_{\underline{\boldsymbol{n}}})^{-1}$$

$$\underline{T}_{\mathsf{ML}} = \underline{T}_{\mathsf{Cor}} = (\underline{S}^{\mathsf{H}} \underline{C}_{\underline{n}}^{-1} \underline{S})^{-1} \underline{S}^{\mathsf{H}} \underline{C}_{\underline{n}}^{-1}$$

 $T_{\mathsf{MF}} \propto C_{m{h}} S^{\mathsf{H}} C_{m{n}}^{-1}$

For Assumption $S^H S = N \sigma_s^2 \mathbf{1}_{K \times M}$ and $C_n = \sigma_n^2 \mathbf{1}_{N \times M}$

	~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~ ~	~ = 1/~11 / 111
Estimator	Averaged Squared Bias	Variance
ML/Correlator	0	$KM \; \frac{\sigma_{\eta}^2}{N\sigma_s^2}$
Matched Filter	$\sum_{i=1}^{KM} \lambda_i \left(rac{\lambda_i}{\lambda_1} - 1 ight)^2$	$\sum_{i=1}^{KM} \left(\frac{\lambda_i}{\lambda_1}\right)^2 \frac{\sigma_{\eta}^2}{N\sigma_s^2}$
MMSE	$\sum_{i=1}^{KM} \lambda_i \left(\frac{1}{1 + \frac{\sigma_\eta^2}{\lambda_i N \sigma_s^2}} - 1 \right)^2$	$\sum_{i=1}^{KM} \frac{1}{\left(1 + \frac{\sigma_{\eta}^2}{\lambda_i N \sigma_s^2}\right)^2} \frac{\sigma_{\eta}^2}{N \sigma_s^2}$

8.5. Estimators

Upper Bound: Uniform in $[0; \theta] : \hat{\theta}_{MI} = \frac{2}{N} \sum x_i$ Probability p for $\mathcal{B}(p, N)$: $\hat{p}_{ML} = \frac{x}{N}$ $\hat{p}_{CM} = \frac{x+1}{N+2}$

Mean
$$\mu$$
 for $\mathcal{N}(\mu, \sigma^2)$: $\hat{\mu}_{\mathsf{ML}}^2 = \frac{1}{N} \sum_{i=1}^N x_i$

Variance
$$\sigma^2$$
 for $\mathcal{N}(\mu, \sigma^2)$: $\hat{\sigma}_{\mathsf{ML}}^2 = \frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2$

9. Gaussian Stuff

9.1. Gaussian Channel

Channel: $Y = hs_i + N$ with $h \sim \mathcal{N}, N \sim \mathcal{N}$ $L(y_1, ..., y_N) = \prod_{i=1}^{n} f_{Y_i}(y_i, h)$ $f_{Y_i}(y_i, h) = \frac{1}{\sqrt{2\pi}\sigma} \exp\left(-\frac{1}{2\sigma^2}(y_i - hs_i)^2\right)$ $\hat{h}_{ML} = \operatorname{argmin}\{\|\underline{y} - h\underline{s}\|^2\} = \frac{\underline{s}^{\top}\underline{y}}{\underline{s}^{\top}\underline{s}}$

If multidimensional channel: y = Sh + n

$$L(\underline{\boldsymbol{y}},\underline{\boldsymbol{h}}) = \frac{1}{\sqrt{\det(2\pi\underline{\boldsymbol{C}})}} \exp\left(-\frac{1}{2}(\underline{\boldsymbol{y}} - \underline{\boldsymbol{S}}\underline{\boldsymbol{h}})^{\top}\underline{\boldsymbol{C}}^{-1}(\underline{\boldsymbol{y}} - \underline{\boldsymbol{S}}\underline{\boldsymbol{h}})\right)$$
$$l(\underline{\boldsymbol{y}},\underline{\boldsymbol{h}}) = \frac{1}{2}\left(\log(\det(2\pi\underline{\boldsymbol{C}}) - (\underline{\boldsymbol{y}} - \underline{\boldsymbol{S}}\underline{\boldsymbol{h}})^{\top}\underline{\boldsymbol{C}}^{-1}(\underline{\boldsymbol{y}} - \underline{\boldsymbol{S}}\underline{\boldsymbol{h}})\right)$$

$$\frac{\mathrm{d}}{\mathrm{d} t} (\boldsymbol{y} - \boldsymbol{S} \underline{\boldsymbol{h}})^{\top} \boldsymbol{C}^{-1} (\boldsymbol{y} - \boldsymbol{S} \underline{\boldsymbol{h}}) = -2 \boldsymbol{S}^{\top} \boldsymbol{C}^{-1} (\boldsymbol{y} - \boldsymbol{S} \underline{\boldsymbol{h}})$$

Gaussian Covariance: if
$$Y \sim \mathcal{N}(0, \sigma^2)$$
, $N \sim \mathcal{N}(0, \sigma^2)$: $C_Y = \text{Cov}[Y, Y] = \text{E}[(Y - \mu)(Y - \mu)^\top] = \text{E}[YY^\top]$

For Channel Y = Sh + N: $E[YY^{\top}] = SE[hh^{\top}]S^{\top} + E[NN^{\top}]$

9.2. Multivariate Gaussian Distributions

A vector \mathbf{x} of n independent Gaussian random variables x_i is jointly Gaussian. If $\underline{\mathbf{x}} \sim \mathcal{N}(\boldsymbol{\mu}_{\underline{\mathbf{x}}}, \underline{\boldsymbol{C}}_{\underline{\mathbf{x}}})$:

$$\begin{split} f_{\underline{\mathbf{x}}}(\underline{\boldsymbol{x}}) &= f_{x_1, \dots, x_n}(x_1, \dots, x_n) = \\ &= \frac{1}{\sqrt{\det(2\pi \underline{C}_{\underline{\mathbf{x}}})}} \exp\left(-\frac{1}{2}\left(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_{\underline{\mathbf{x}}}\right)^{\top} \underline{C}_{\underline{\mathbf{x}}}^{-1}\left(\underline{\boldsymbol{x}} - \underline{\boldsymbol{\mu}}_{\underline{\mathbf{x}}}\right)\right) \end{split}$$

Affine transformations $\mathbf{y} = \mathbf{\underline{\tilde{A}x}} + \mathbf{\underline{b}}$ are jointly Gaussian with

$$\underline{\mathbf{y}} \sim \mathcal{N}(\underline{\underline{\mathbf{A}}}\underline{\underline{\boldsymbol{\mu}}}_{\mathbf{x}} + \underline{\boldsymbol{b}}, \underline{\underline{\mathbf{A}}}\underline{\underline{\mathbf{C}}}\underline{\mathbf{x}}\underline{\underline{\mathbf{A}}}^{\top})$$

All marginal PDFs are Gaussian as well

Ellipsoid with central point E[y] and main axis are the eigenvectors of

9.3. Conditional Gaussian

$$\begin{array}{l} \underline{A} \sim \mathcal{N}(\underline{\mu}_{\underline{A}}, \underline{C}_{\underline{A}}), \underline{B} \sim \mathcal{N}(\underline{\mu}_{\underline{B}}, \underline{C}_{\underline{B}}) \\ \Rightarrow (\underline{A} | \underline{B} = b) \sim \mathcal{N}(\underline{\mu}_{A | B}, \underline{C}_{\underline{A} | \underline{B}}) \end{array}$$

$$\begin{array}{l} \text{Conditional Mean:} \\ \mathbf{E}[\underline{A}|\underline{B}=\underline{b}] = \underline{\mu}_{\underline{A}|\underline{B}=\underline{b}} = \underline{\mu}_{\underline{A}} + \underline{C}_{\underline{A}\underline{B}} \; \underline{C}_{\underline{B}\underline{B}}^{-1} \; \left(\underline{b} - \underline{\mu}_{\underline{B}}\right) \end{array}$$

Conditional Variance:

$$\underline{C}_{\underline{A}|\underline{B}} = \underline{C}_{\underline{A}\underline{A}} - \underline{C}_{\underline{A}\underline{B}} \ \underline{C}_{\underline{B}\underline{B}}^{-1} \ \underline{C}_{\underline{B}\underline{A}}$$

If CDF of gaussian distribution given $\Phi(z) \sim \mathcal{N}(0,1)$ then for $X \sim$ $\mathcal{N}(1,1)$ the CDF is given as $\Phi(x-\mu_x)$

10. Sequences

10.1. Random Sequences

Sequence of a random variable. Example: result of a dice is RV, roll a dice several times is a random sequence

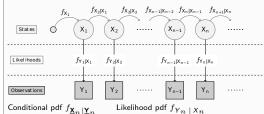

10.2. Markov Sequence $X_n:\Omega \to X_n$

Sequence of memoryless state transitions with certain probabilities.

- 1. state: $f_{X_1}(x_1)$
- 2. state: $f_{X_2 | X_1}(x_2 | x_1)$
- n. state: $f_{X_n | X_{n-1}}(x_n | x_{n-1})$

10.3. Hidden Markov Chains

Problem: states X_i are not visible and can only be guessed indirectly as a random variable Y_i .

Likelihood pdf $f_{Y_n \mid X_n}$

State-transision pdf $f_{X_n \mid X_{n-1}}$

$$f_{\underline{\mathbf{X}}_{n}|\underline{\mathbf{Y}}_{n}} \propto f_{\underline{\mathbf{Y}}_{n}|\underline{\mathbf{X}}_{n}} \cdot \int_{\mathbb{X}} f_{\underline{\mathbf{X}}_{n}|\underline{\mathbf{X}}_{n-1}} \cdot f_{\underline{\mathbf{X}}_{n-1}|\underline{\mathbf{Y}}_{n-1}} d\underline{\mathbf{x}}_{n-1}$$

11. Recursive Estimation

11.1. Kalman-Filter

recursively calculates the most likely state from previous state estimates and current observation. Shows optimum performance for Gauss-Markov

$$\underline{\underline{x}}_n = \underline{\underline{G}}_n \underline{\underline{x}}_{n-1} + \underline{\underline{B}} \underline{\underline{u}}_n + \underline{\underline{v}}_n$$
$$\underline{\underline{y}}_n = \underline{\underline{H}}_n \underline{\underline{x}}_n + \underline{\underline{w}}_n$$

With gaussian process/measurement noise $\underline{\boldsymbol{v}}_n/\underline{\boldsymbol{w}}_n$ Short notation: $\mathsf{E}[\underline{x}_n|\underline{y}_{n-1}] = \hat{\underline{x}}_{n|n-1} \overline{\mathsf{E}}[\underline{x}_n|\underline{y}_n] = \hat{\underline{x}}_{n|n}$ $\mathsf{E}[\underline{\boldsymbol{y}}_n|\underline{\boldsymbol{y}}_{n-1}] = \underline{\hat{\boldsymbol{y}}}_{n|n-1} \quad \mathsf{E}[\underline{\boldsymbol{y}}_n|\underline{\boldsymbol{y}}_n] = \underline{\hat{\boldsymbol{y}}}_{n|n}$

1. step: Prediction

$$\begin{array}{l} \text{Mean: } \underline{\hat{x}}_{n|n-1} = \underline{G}_n \underline{\hat{x}}_{n-1|n-1} \\ \text{Covariance: } \underline{C}_{\underline{x}_{n|n-1}} = \underline{G}_n \underline{C}_{\underline{x}_{n-1|n-1}} \underline{G}_n^\top + \underline{C}_{\underline{v}} \end{array}$$

$$\begin{array}{l} \text{Mean: } \underline{\hat{x}}_{n|n} = \underline{\hat{x}}_{n|n-1} + \underbrace{K}_n \left(\underline{y}_n - \underbrace{H}_n \underline{\hat{x}}_{n|n-1}\right) \\ \text{Covariance: } \underline{C}_{\underline{x}_{n|n}} = \underline{C}_{\underline{x}_{n|n-1}} + \underbrace{K}_n \underbrace{H}_n \underline{C}_{\underline{x}_{n|n-1}} \end{array}$$

correction:
$$\mathsf{E}[\mathsf{X}_n \mid \Delta \mathsf{Y}_n = y_n]$$

$$\underline{\hat{x}}_{n|n} = \underbrace{\hat{x}_{n|n-1}}_{\text{estimation E}[X_n]} \underbrace{Y_{n-1} = y_{n-1}]}_{\text{y}_{n-1} = y_{n-1}]} + \underbrace{K_n \left(\underline{y}_n - \underline{H}_n \hat{x}_{n|n-1}\right)}_{\text{innovation:} \Delta y_n}$$

With optimal Kalman-gain (prediction for \underline{x}_n based on Δy_n):

$$\underbrace{\mathcal{K}_n = \mathcal{C}_{\underline{\boldsymbol{w}}_n|_{n-1}} \mathcal{H}_n^{\top} (\underbrace{\mathcal{H}_n \mathcal{C}_{\underline{\boldsymbol{w}}_n|_{n-1}} \mathcal{H}_n^{\top} + \mathcal{C}_{\underline{\boldsymbol{w}}_n}}_{\mathcal{C}_{\delta y_n}})^{-1}}_{\mathcal{C}_{\delta y_n}}$$

Innovation: closeness of the estimated mean value to the real value $\Delta \underline{\underline{y}}_n = \underline{\underline{y}}_n - \underline{\hat{y}}_{n|n-1} = \underline{\underline{y}}_n - \underline{H}_n \underline{\hat{x}}_{n|n-1}$

$$\begin{vmatrix} \text{Init: } \underline{\hat{x}}_{0|-1} = \mathsf{E}[X_0] & \sigma_{0|-1}^2 = \mathsf{Var}[X_0] \\ \text{MMSE Estimator: } \underline{\hat{x}} = \int \underline{x}_n f_{X_n \mid Y_{(n)}} (\underline{x}_n | \underline{y}_{(n)}) \, \mathrm{d}\underline{x}_n \end{aligned}$$

For non linear problems: Suboptimum nonlinear Filters: Extended KF Unscented KF ParticleFilter

11.2. Extended Kalman (EKF)

11.3. Unscented Kalman (UKF)

Approximation of desired PDF $f_{X_n|Y_n}(x_n|y_n)$ by Gaussian PDF.

11.4. Particle-Filter

For non linear state space and non-gaussian noise

Non-linear State space:

$$\begin{vmatrix} \underline{\boldsymbol{x}}_n = g_n(\underline{\boldsymbol{x}}_{n-1}, \underline{\boldsymbol{v}}_n) \\ \underline{\boldsymbol{y}}_n = h_n(\underline{\boldsymbol{x}}_{n-1}, \underline{\boldsymbol{w}}_n) \end{vmatrix}$$

$$\begin{aligned} & \text{Posterior Conditional PDF: } f_{X_n|Y_n}(x_n|y_n) \propto f_{Y_n|X_n}(y_n|x_n) \\ & \cdot \int\limits_{\mathbb{X}} \underbrace{f_{X_n|X_{n-1}}(x_n|x_{n-1})}_{\mathbb{X}} \underbrace{f_{X_{n-1}|Y_{n-1}}(x_{n-1}|y_{n-1})}_{\mathbb{X}} \mathrm{d}x_{n-1} \end{aligned}$$

N random Particles with particle weight w_{∞}^i at time n

Monte-Carlo-Integration:
$$I = \mathsf{E}[g(\mathsf{X})] \approx I_N = \frac{1}{N} \sum_{i=1}^N \tilde{g}(x^i)$$

Importance Sampling: Instead of $f_{X}(x)$ use Importance Density $q_{X}(x)$

$$I_N = \frac{1}{N} \sum\limits_{i=1}^N \tilde{w}^i g(x^i)$$
 with weights $\tilde{w}^i = \frac{f \chi(x^i)}{q \chi(x^i)}$

If
$$\int f_{X_n}(x) dx \neq 1$$
 then $I_N = \sum_{i=1}^N \tilde{w}^i g(x^i)$

11.5. Conditional Stochastical Independence

$$\mathsf{P}(A\cap B|E)=\mathsf{P}(A|E)\cdot\mathsf{P}(B|E)$$

Given
$$Y$$
, X and Z are independent if
$$\begin{aligned} f_{Z\mid Y,X}(z|y,x) &= f_{Z\mid Y}(z|y) \text{ or } \\ f_{X,Z\mid Y}(x,z|y) &= f_{Z\mid Y}(z|y) \cdot f_{X\mid Y}(x|y) \\ f_{Z\mid X,Y}(z|x,y) &= f_{Z\mid Y}(z|y) \text{ or } f_{X\mid Z,Y}(x|z,y) = f_{X\mid Y}(x|y) \end{aligned}$$

12. Hypothesis Testing

making a decision based on the observations

12.1. Definition

Null hypothesis $H_0: \theta \in \Theta_0$ (Assumed first to be true) Alternate hypothesis $H_1: \theta \in \Theta_1$ (The one to proof)

Descision rule $\varphi: \mathbb{X} \to [0,1]$ with

 $\varphi(x)=1$: decide for H_1 , $\varphi(x)=0$: decide for H_0 Error level α with $\mathsf{E}[d(\mathsf{X})|\theta] \le \alpha, \forall \theta \in \Theta_0$

Error Type	Decision Reality	H_1 false (H_0 true)	H_1 true (H_0 false)
1 (FA) False	H_1 rejected	True N egative	False Negative (Type 2)
Alarm	$(H_0 \ {\it accepted})$	$P = 1 - \alpha$	$P = \beta$
2 (DE)	H_1 accepted	False Positive (Type 1)	True Positive
Detection Error	$(H_0 \text{ rejected})$	$P = \alpha$	$P=1-\beta$

Power: Sensitivity/Recall/Hit Rate: $\frac{\text{TP}}{\text{TP}+\text{FN}}=1-\beta$ Specificity/True negative rate: $\frac{\text{TN}}{\text{FP}+\text{TN}}=1-\alpha$ Precision/Positive Prediciton rate: $\frac{TP}{TP+FP}$ Accuracy: $\frac{TP+TN}{P+N} = \frac{2-\alpha-\beta}{2}$

12.1.1. Design of a test Cost criterion $G_{\varphi}:\Theta \to [0,1], \theta \mapsto \mathrm{E}[d(X)|\theta]$

False Positive lower than α : $G_d(\theta)|_{\theta\in\Theta_0}\leq \alpha, \forall \theta\in\Theta_0$ False Negative small as possible: $\max\{G_d(\theta)|_{\theta\in\Theta_1}\}, \forall \theta\in\Theta_1$

12.2. Sufficient Statistics

Sufficiency for a test T(X) means that no other test statistic, i.e., function of the observations \underline{x} , contains additional information about the parameter θ to be estimated:

$$f_{X\mid T}(x|T(x)=t,\theta)=f_{X\mid T}(x|T(x)=t)$$

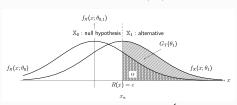

13. Tests

13.1. Neyman-Pearson-Test

$$\begin{aligned} & \text{The best test of P}_0 \text{ against P}_1 \text{ is} \\ & d_{\mathsf{NP}}(x) = \begin{cases} 1 & R(x) > c & \mathsf{Likelihood\text{-Ratio:}} \\ \gamma & R(x) = c \\ 0 & R(x) < c & R(x) = \frac{f_X(x;\theta)}{f_X(x;\theta)} \end{aligned}$$

 $\gamma = \frac{\alpha - \mathrm{P}_0(\{R > c\})}{\mathrm{P}_0(\{R = c\})} \quad \text{Errorlevel } \alpha$

Steps: For α calculate x_{α} , then $c = R(x_{\alpha})$

Maximum Likelihood Detector: $d_{ML}(x) = \begin{cases} 1 & R(x) > 1 \\ 0 & \text{otherwise} \end{cases}$

ROC Graphs: plot $G_d(\theta_1)$ as a function of $G_d(\theta_0)$

13.2. Bayes Test (MAP Detector)

Prior knowledge on possible hypotheses: $P(\{\theta \in \Theta_0\}) + P(\{\theta \in \Theta_0\})$ Θ_1 }) = 1, minimizes the probability of a wrong decision.

$$d_{\mathsf{Bayes}} = \begin{cases} 1 & \frac{f_{\mathsf{X}}(x|\theta_1)}{f_{\mathsf{X}}(x|\theta_0)} > \frac{c_0 \, \mathsf{P}(\theta_0|x)}{c_1 \, \mathsf{P}(\theta_1|x)} \\ 0 & \mathsf{otherwise} \end{cases} = \begin{cases} 1 & \mathsf{P}(\theta_1|x) > \mathsf{P}(\theta_0|x) \\ 0 & \mathsf{otherwise} \end{cases}$$

Risk weights c_0,c_1 are 1 by default. If $\mathsf{P}(\theta_0)=\mathsf{P}(\theta_1)$, the Bayes test is equivalent to the ML test

13.3. Linear Alternative Tests

$$d: \mathbb{X} \to \mathbb{R}, \underline{\boldsymbol{x}} \mapsto \begin{cases} 1 & \underline{\boldsymbol{w}}^\top \underline{\boldsymbol{x}} - w_0 > 0 \\ 0 & \text{otherwise} \end{cases}$$

Estimate normal vector \underline{w}^{\top} , which separates \mathbb{X} into \mathbb{X}_0 and \mathbb{X}_1 $\log R(\underline{x}) = \frac{\ln(\det(\underline{C}_0))}{\ln(\det(\underline{C}_1))} + \frac{1}{2}(\underline{x} - \underline{\mu}_0)^{\top}\underline{C}_0^{-1}(\underline{x} - \underline{\mu}_0) -$

$$-\frac{1}{2}(\boldsymbol{x}-\boldsymbol{\mu}_1)^{\top}\boldsymbol{C}_1^{-1}(\boldsymbol{x}-\boldsymbol{\mu}_1)=0$$

$$-\frac{1}{2}(\underline{x}-\underline{\mu}_1)^{\top}\underline{C}_1^{-1}(\underline{x}-\underline{\mu}_1)=0$$
 For 2 Gaussians, with $\underline{C}_0=\underline{C}_1=\underline{C}$: $\underline{w}^{\top}=(\underline{\mu}_1-\underline{\mu}_0)^{\top}\underline{C}$ and constant translation $w_0=\frac{(\underline{\mu}_1-\underline{\mu}_0)^{\top}\underline{C}(\underline{\mu}_1-\underline{\mu}_0)}{2}$
